

## Low Quiescent Current Synchronous Boost Regulator with low output voltage ripple

### ■ INTRODUCTION

The SMD207 is a compact, high-efficiency, synchronous step-up DC-DC converter. This family of devices provides an easy-to-use power supply solution for applications powered by either one-cell, two-cell or three-cell alkaline, NiCd, NiMH, one-cell Li-Ion or Li-Polymer batteries. It stays in operation with supply voltage down to 0.7V. The SMD207 adopts hysteresis current control topology to adjust the output voltage by keeping inductor current constant which makes the output voltage ripple very small. High efficiency is accomplished by integrating the low-resistance N-Channel boost switch and synchronous P-Channel switch. All compensation and protection circuitry are integrated to minimize external components. Output voltage is set by a small external resistor divider.
